Lecture 2

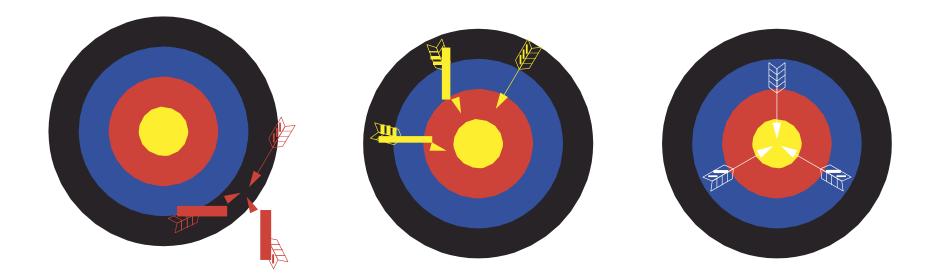

Measurement (2)

Mohamad Fathi GHANAMEH

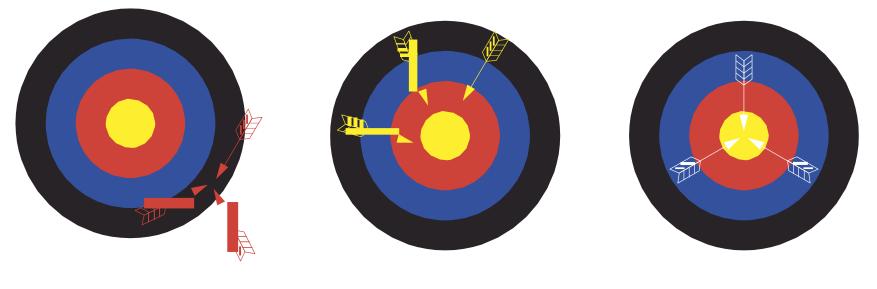

Precision is about how close measurements are to one another.

Accuracy is about how close measurements are to the 'true answer.

Low accuracy, but high precision

Higher accuracy, but low precision

High accuracy and high precision

الجاوعــــــــــة الدوليـــــــة للربـــــــ @∧هال≲+ +هXOه∀اها+ ا QQ⊖هE niversité Internationale de Rabat

Accuracy	a qualitative term that describes how close a set of measurements are to the actual (true) value
Precision	describes the spread of these measurements when repeated - a measurement that has high precision has good repeatability
Uncertainty	is the quantification of the doubt about the measurement result and tells us something about its quality
True value	is the value that would be obtained by a theoretically perfect measurement

الجامعـــــــــة الدوليـــــــة الربـــــاط +ه،٢٥٥،٤٤ +ه،٢٥٥،۲٧،١٤ المه.٤ Université Internationale de Rabat

In practice we are not able to view the target and assess how close to the 'true answer' our measurements are. What interests us is the answer to the question "How far from the target could our arrows have fallen?" and we also need to ask "How wrong could we have been?"

Mistakes + Errors

'error' to specify the difference between an estimate of quantity and its 'true value'. The word 'error' does not imply that any mistakes have been made.

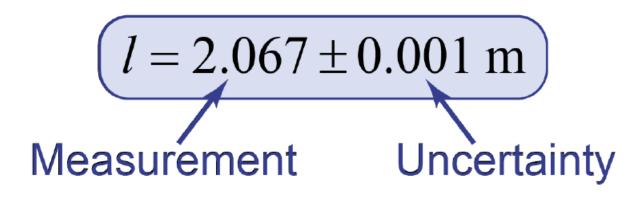

ALL measurements have some uncertainty.

Uncertainty can be expressed in this way:

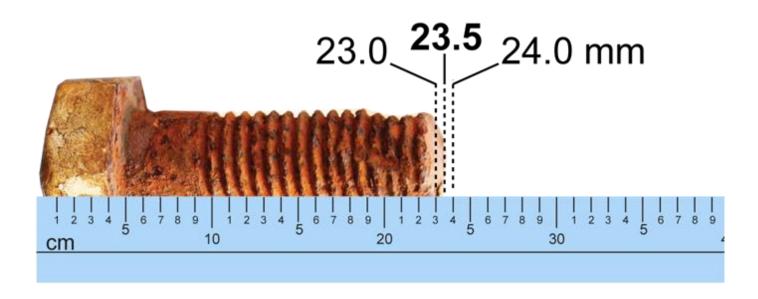

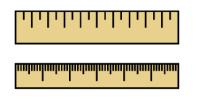

Many factors can reduce accuracy or precision and increase the uncertainty of your measurement result. Some of the most common are:

UR

1- Inferior measuring equipment – equipment which is poorly maintained, damaged or not calibrated will give less reliable results.

The measuring system might be inadequate.

Example: a ruler with gradations that are too large

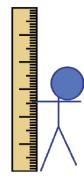

الجاوعـــــــة الدوايـــــــة للربــــــاد ۲۰۵۸۰⊔۲ +۵۲۵۰۲۵۰−۲۵ Jniversité Internationale de Rabat

2- Poor measuring techniques – having consistent procedures for your measurements is vital. The measuring procedure might have shortcomings.

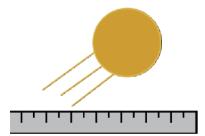

Example: trying to measure a wiggling child

الجامعـــــــة الدوليــــــة للربـــــاد ٥٠٩٥هـ المالاهـ٥٨هـ المالههـ المالههـ Jniversité Internationale de Rabat

3- Environmental conditions – changes in temperature or humidity can expand and contract materials as well as affect the performance of measurement equipment. The environment causes problems.

Example: a ruler that heats up and expands

الجامعـــــــة الدوليــــــة للربــــــا ⊙∧₀⊔Հ+ +₀XO₀YII₀I+ I QQ⊖₀E niversité Internationale de Rabat

4- Inadequate staff training – not knowing how to make the right measurement, not having the confidence to challenge the results and not being willing to seek advice can all have a negative impact. The operator could make an error.

Example: due to poor eyesight or lack of skill

Golden Rule

Measure twice and cut once.

Repeatability, Reproducibility

Repeatability	is the closeness of agreement between repeated measurements of the same thing, carried out in the same place, by the same person, on the same equipment, in the same way, at similar times
Reproducibility	is the closeness of agreement between measurements of the same thing carried out in different circumstances, e.g. by a different person, or a different method, or at a different time
Tolerance	is the maximum acceptable difference between the actual value of a quantity and the value specified for it

When we talk about traceability of measurements, we mean that the measurements can be related to a national standard through a documented unbroken chain of calibrations.

الجائعـــــــة الدوليـــــــة للربــــــاد -₀⊙∧₀⊔٤+ +₀XO₀۲N₀I+ I QQ⊖₀E Jniversité Internationale de Rabat

Six of the SI definitions are the procedures needed to 'realise' literally, to make real – the standard or a close approximation of it. This applies to the second, metre, kelvin, ampere, candela and mole.

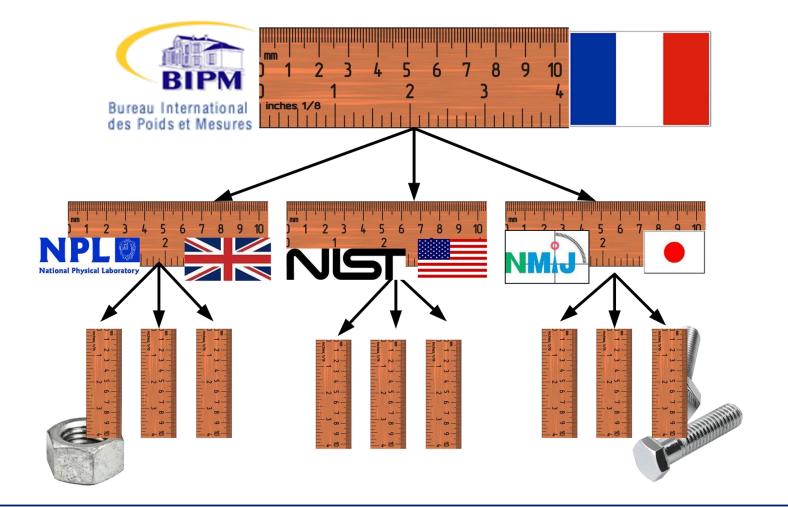

The seventh base unit – the kilogram – is not based on a procedure, but instead on a single physical artefact, a cylinder made up of platinum and iridium metals, which is kept in a safe in the International Bureau of Weights and Measures (BIPM), on the outskirts of Paris, France.

Traceability Chain

Calibration	is the comparison of a test instrument or artefact against a more accurate standard
Measurement traceability	refers to the unbroken chain of calibrations linking an instrument or standard to primary standards
Accreditation	means that a calibration laboratory in a specific field has been independently assessed and audited to show that it is competent to carry out specific tests and calibrations in that field.

الجاری الدولی آلاری الرای الرای المرای ا Université Internationale de Rabat

The internationally agreed procedures that describe how a laboratory should carry out accurate measurements on specific items are called 'International Standards', and the International Organization for Standardization (ISO), based in Geneva, Switzerland, is responsible for publishing and revising them. National standardization bodies such as BSI (British Standards Institution) participate in the preparation of international standards and also prepare standards which address national measurement needs not covered by ISO standards.

ISO 17025, 'General requirements for the competence of testing and calibration laboratories' is the standard that specifies how the national standardization bodies accredit calibration laboratories.
